FLOSS = Data

Editorial: Open Source and Empirical Software Engineering

Until recently, few of the empirical software engineering research community took open source software as an object of study seriously. To many, it was one step up from studying student projects, and the “real action” was almost always with commercial software products. When queried, the typical response was that open software products weren’t used seriously, and perhaps that open source represented an unrepresentative software development “niche” that had little societal relevance (read that as “insignificant”).

That was then and this is now.

As empirical software engineers, we should embrace this development. Suddenly one of the greatest obstacles in the way of empirical software engineering has been cleared! Not only is source code available, but also defect reports, update logs, etc. For a change, we can now focus on the analysis rather than the data collection. At the same time, we can no longer claim lack of progress on the “inability to gather data due to proprietary restrictions”. The burden is now on us.

Empirical Software Engineering, 6, 193–194, 2001.

Our research question*

What work practices make
some FLOSS teams more
effective than others?

* Our = Kevin Crowston, Hala Annabi, James Howison, Chengetai Masango, Yeliz Eseryel, Kangning Wei and Qing Li
Partially supported by US NSF Grants 03-41475 and 04-14468.

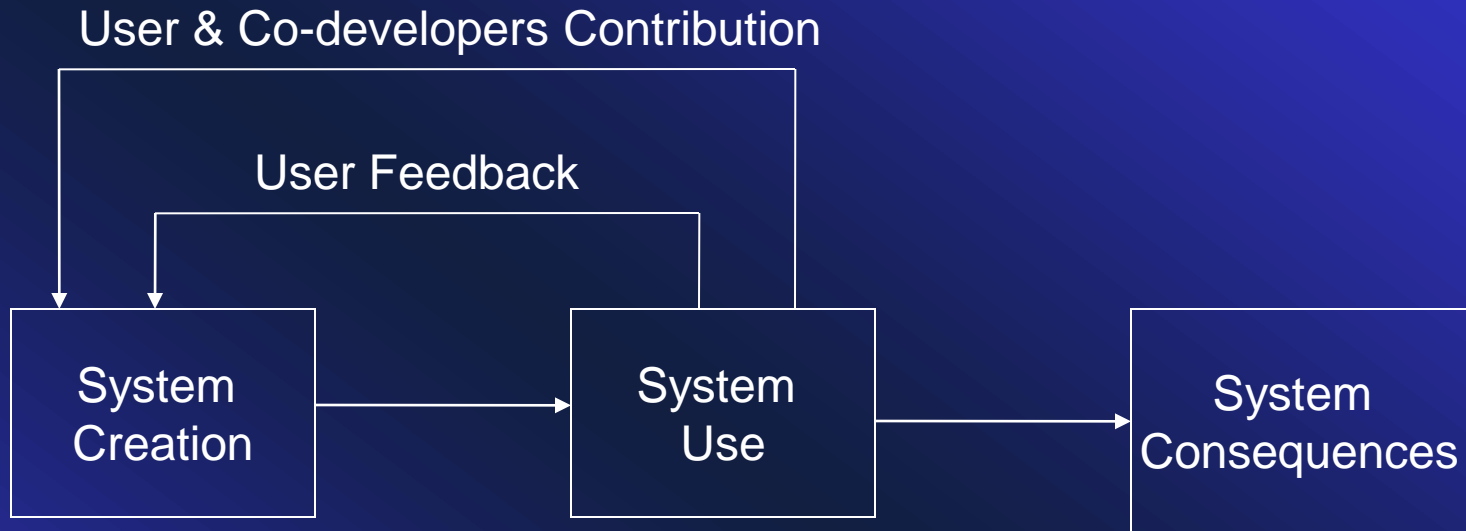

Success measures in IS

DeLone & McLean (1992):

Seddon (1997): system quality, information quality, perceived usefulness, user satisfaction, and IS use

Our success model

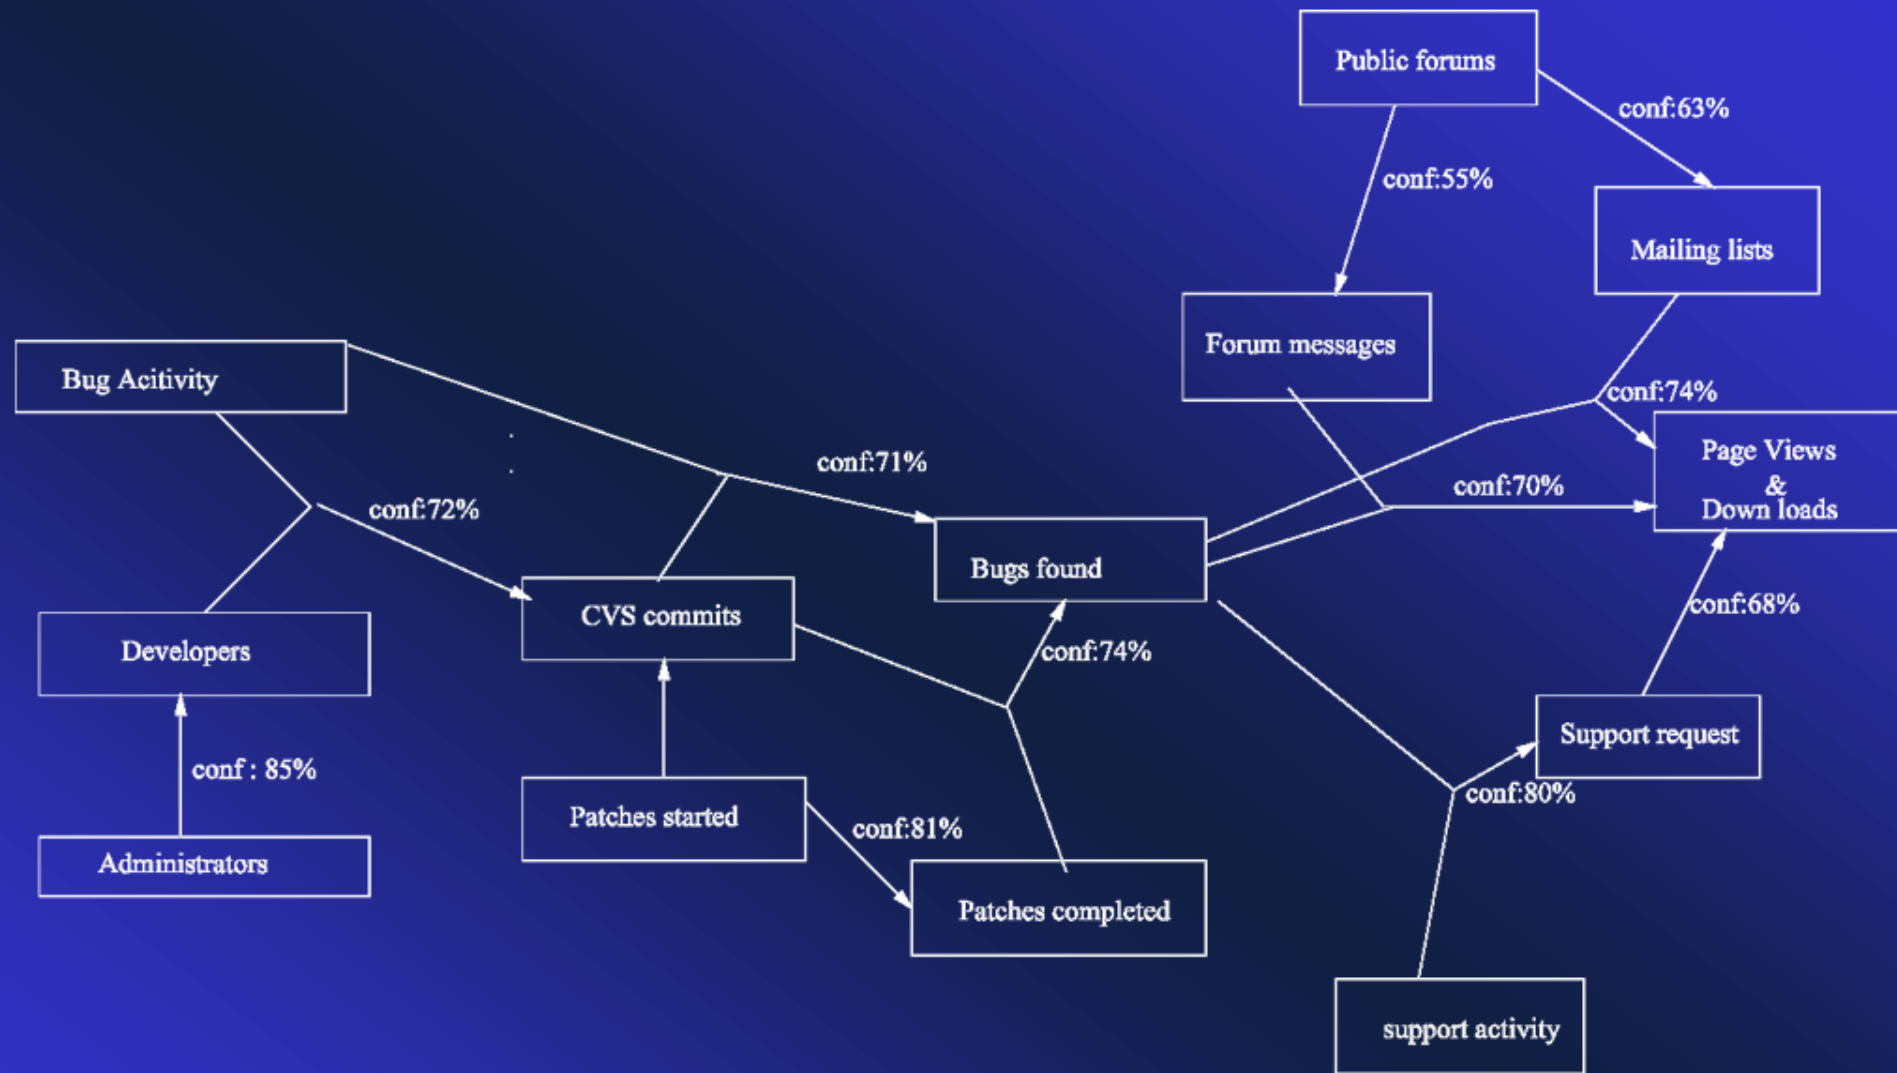

- Project completion
- Progress of process
- Number and frequency of releases
- Number of developers

- Users
- “Popularity”
- Downloads
- Page views

- Meets development goals
- Developer satisfaction

Hackman's Group Effectiveness Model

Task Structure: Coordination theory

- ⊕ Addressing task structure through Coordination Theory (Malone & Crowston, 1994)
 - ⊕ Actors in organizations face coordination problems arising from interdependencies that constrain how tasks can be performed
 - ⊕ Coordination problems require additional work in the form of coordination mechanisms
- ⊕ Propositions:
 - ⊕ Teams with task structures and practices that minimize dependencies will be more effective
 - ⊕ Teams with coordination practices to manage dependencies will be more effective

Team synergy: Collective Mind

- ⊕ Addressing Team Synergy through “Collective Mind” (Weick & Roberts, 1993)
 - ⊕ Subordination (Alignment)
 - ⊕ Contribution
 - ⊕ Representation
- ⊕ Propositions
 - ⊕ Teams with more highly developed shared mental models will be more effective.
 - ⊕ Teams which are able to align individual goals and team goals will be more effective
 - ⊕ Teams with higher levels of socialization, conversation and narration will display more highly developed shared mental models

Practices of interest

- ⊕ Team social structure
- ⊕ Coordination of tasks
- ⊕ Development of collective mind, rules and norms
- ⊕ Team leadership
- ⊕ Member recruitment and socialization

Summary:

New incoming convo takes focus

Alpha 5, Win2000

When I'm typing to a buddy (aim) and another buddy sends me the first message of a conversation, the focus is stolen from my text box and placed on the newly created tab. So, my continuing to type is futile.

I think this is new to Alpha 5.

Learning in FLOSS Teams

⊕ From a study of Apache httpd

- ⊕ Learning episodes more often triggered by core group member (75%)
- ⊕ Learning episodes most often lead to development of shared mental model (76%)
- ⊕ Focus of learning was on product (code) rather than process

Summary:

New incoming convo takes focus

Alpha 5, Win2000

When I'm typing to a buddy (aim) and another buddy sends me the first message of a conversation, the focus is stolen from my text box and placed on the newly created tab. So, my continuing to type is futile.

I think this is new to Alpha 5.

Followups:
